

## **12/8/21 Root Cause Notes**

### **New features added:**

- Add employee
- New employee category

### **Features fixed:**

- Proper string & digits assigned to entry fields
- Error messaging addressed
- Negative employee number removed

### **Things I'd like to see:**

- Better more stylish design.
- Site lacks any styling.
- Too basic visually to present as finished to the customer.
- User flow is seamless.
- Email entry feature needed.
- Search bar feature needed.
- Log in, Log out feature required.
- Inputs for numbers need proper formatting.
- Database to store user data on backend.

More CSS & a color scheme, perhaps logo implementation all to add more style to the design.

Create an additional input box for emails.

Create a search bar link to a database.

Create Login/Out first page.

Generate database to be synced w/front-end.

### **Notes on Customer End:**

- Customer will require more styling.
- As well as the email input field.
- And search bar.

Design issues are yet to be addressed as the styling will most likely be the last step.

Search bar feature will be pending database deployment.

Email input is to follow "new employee" add feature, just deployed on the most recent update.

### **Present Update to Customer:**

Version 1.2 of the app has launched and you will notice updates from the previous version. As well as some errors corrected. Everything is still going according to the timeline & flowchart initially presented. Styling is always the last task after all foundational work is complete & all functionality is tested. Now that the “employee add” has been deployed we can begin on the email input request. The search bar feature will be pending database initialization, or else there will be no information to access via the search bar. Database is currently being initiated.

### **QAManager Update:**

Coordinated w/customer on issues. Informed customer on the update to new employee input. Next update will look for an email input field update. Informed customer of resolved errors including:

- Correcting the negative digit attributed to employee 4.
- Setting proper alphanumeric parameters for each entry field.
- Ability to add “new employee:.”
- Error messages corrected.

Updated customer on pending requests. Customer is aware that styling will be addressed as finalization occurs. Also the customer’s request for search bar implementation is pending database execution.
